1. Notes on Special Load Readings

1.1. Special Load Readings

Special Load readings (SLR) are a coincident set of measurements of simultaneous demand for all distribution substations, adjusted where necessary to represent normal system configuration. The results represent the underlying demand with any embedded generation netted off. Readings are recorded for four times annually.

- Winter: The winter day is determined in late January by a look back at system peak information from Eirgrid. Two reading are provided for the Winter Day, i.e. at 12:30 and 18:00
- Summer Peak: Measured at 12.30 hours on the fourth Thursday of June.
- Summer Valley: Measured at 06.00 hours on the Sunday preceding the early August Monday Public Holiday

1.2. System Peak / SLR Day Loading

Reading	System Demand MW	Date/time
Summer Peak		27/06/2024 12:30
Summer Valley		04/08/2024 06:00
Winter Midday	5588	08/01/2025 12:30
Winter Evening	6020	08/01/2025 18:00

A Peak Correction Factor (PCF) of 1.0 and 1.0 have been applied respectively to the readings taken at 12:30 and 18:00 on SLR day.

1.3. Data sources and adjustment

Most readings are acquired via Scada. Bulk supply point metering is used where it is available, which is usually 110 kV stations. In addition, customer profile metering records are used for MV and HV connected customer.

An extensive collation and reconciliation process is completed to prepare the final report. Data cleansing algorithms are applied to adjust for faulty/non-existant data.

1.4. Data Assumptions

Results are presented as MW and MVAr however certain assumptions have been made in the preparation process.

- Values recorded in Amps are converted assuming 0.95 power factor and nominal voltages.
- Balanced three phase loads are assumed.

- MW and MVAr values, where available, are used as a superior measure to Amps
- Bulk supply point measured values are taken as better accuracy than Scada
- Customer revenue metering values are taken as better accuracy than equivalent Scada points.

1.5. Colour Legend
